FEATURES SOUTCE

1. .1011

Location/Qualifiers

Series: IRAL Plate: 37 Row: g Column: 11
This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA g1: 15718678
This clone has the following problem: frame shifted.

Amplification products were subcloned and sequences; one clone (designated pSK-MP121) was found to contain a new sequence. Part of the insert from the clone was used to re-screen the human liver cDNA library and a 2272 bp fragment coding for a TGF-beta-like protein (i.e. the present sequence) was isolated. This protein has mitogenic and differentiation-inducing properties making it (or fusion proteins comprising it or heterodimers of the protein with a cystine knot motif protein) useful for inducing tissue regeneration, e.g. for wound healing, inducing growth of the protein with a cystine knot motif protein inducing fortains.

CC indicated. Diseases treatable include diseases associated with bone CC and/or cartilage damage or affecting bone and/or cartilage disease or CC situations in which cartilage and/or bone growth is desirable, for spinal CC fusion, for damaged or diseased tissue associated with connective tissue CC including tendon and/or ligament, periodontal or dental tissue including CC dental implants, neural tissue including CNS tissue and neuropathological CC situations, tissue of the sensory system, liver, pancreas, cardiac, CC blood vessel, renal, uterine and thyroid tissue, skin, mucous membrane, CC tissue regeneration, angiogenesis, wound healing including ulcers, burns, CC tissue regeneration, angiogenesis, wound healing including ulcers, burns, CC or bone marrow cells, for maintenance of a state of proliferation or CC differentiation, for treatment or preservation of tissue or cells for organ or tissue transplantation, for integrity of gastrointestinal lining CC and for treatment of disturbances in fertility, contraception or pregnancy. The present sequence represents the specifically claimed CC TGF beta monomeric protein MPI21, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a protein (I) selected from the members of the transforming growth factor-beta (TGF-beta) superfamily, which is monomeric due to substitution or deletion of a cysteine which is responsible for dimer formation. Also described are: (1) nucleic acid (II) encoding (I); (2) expression vector (III) containing (II) in a suitable vector system; (3) host cell (IV) containing (III) capable of producing (I); and (4) a pharmaceutical composition (V) containing (I), (III) or (IV). (I) has vulnerary, antiulcer, nootropic, neuroprotective, antiinfertility and osteopathic activities, and can be used in gene therapy. (V) is useful for the prevention or therapy of diseases for which also the dimeric form of the protein would be indicated with the content of the protein would be

This represents a murine liver activin beta c polypeptide. Sequences derived from beta c cDNA clone is used for screening and cloning a liver activin beta e gene. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene. Disorders of haematopolesis, erythroid differentiation, ovarian follicular maturation, hormone secretion, neuronal survival, spermatogenesis, bone formation, insulin secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and differentiation can be stimulated by treatment with an liver activin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cleavage-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified-site

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                compound or agent that upregulates the compound's expression. Antagonists can be used to treat liver diseases while agonists can be used to increase growth and regeneration of liver tissue. The liver activin compound may also induce bone growth (e.g. for treating osteoporosis or osteomalacia) or haematopoiesis, particularly erythropoiesis, e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which bind to liver activin receptors) and to inhibit liver activin. Also, transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, or the transgenic animals, are useful for screening for liver activin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modulators.

It can be obtd. by expression of a cDNA clone (AAT16883) derived from adult liver in transformed host cells. GDF-12 possesses activities that will make it useful in the treatment of liver disorders, e.g. disease states in which liver function is compromised, or cellular proliferative disorders such as hepatocellular carcinoma. In can also be used to expand liver cells in culture and to raise diagnostic antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                clones. 80 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                       295

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Кeу
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human liver activin beta e polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cleavage-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens.
                                                                                                                                                                        liver diseases while agonists can be used to increase growth and regeneration of liver tissue. The liver activin compound may also induce bone growth (e.g. for treating osteoporosis or osteomalacia) or haematopoiesis, particularly erythropolesis, for treating haemorphila, cystic fibrosis or menstrual disorders. Antibodies are useful in cystic fibrosis or menstrual disorders antibodies (which bind to liver activin receptors) and to inhibit liver activin. Also, transgenic administrative activin giver activin modulators.
                                                                                                                                                                                                                                                                                                                                                                        secretion, negative morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and differentiation can be stimulated by treatment with an liver activin compound or agent that upregulates the compound's expression. Antagonists can be used to treat the compound of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene. Disorders of haematopoiesis, erythroid differentiation, ovarian follicular maturation, hormone secretion, neuronal survival, spermatogenesis, bone formation, insulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This represents a human liver activin beta e polypeptide. The invention provides murine beta c and beta e polypeptides and the encoding genes, bisorders of cell growth or differentiation (or susceptibility to them).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid encoding sub-units of liver activin - useful for regulating growth and differentiation of cells, e.g. for treating liver, bone and haematopoietic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (UNMI ) UNIV MICHIGAN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      aturation, hormone secretion, neuronal survival, spermatogenesis, bone of commetion, insulin secretion or cardiac morphogenesis are some conditions that can be diagnosed using the liver activin. Cell growth and compound or agent that upregulates the compound's expression. Antagonists of increase growth and regeneration of liver tissue. The liver activin occumpound may also induce bone growth (e.g. for treating osteoporosis or osteomalacia) or haematopolesis, particularly erythropolesis, e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which to liver activin receptors) and to inhibit liver activin. Also, the stransgenic animals containing liver activin gene can be used to produce or the transgenic animals, are useful for screening for liver activin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Sequences derived from a beta c cDNA clone is used for screening and cloning the activin beta e gene. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene activity or by detecting a mutation in the liver activin gene. Disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               352 S 352

                                                                                                                                                                                   Matches
                                                                                                                                               Query Match
                                                                                                                                                                                                                                                          mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological mutant transformations.
                                                                                                                                                                                Sequence
                                                                                                                                                                                                        Mutant transforming growth factor family proteins or analogues are useful for treatment of ovulatory dysfunction, luteal phase defect, unexplained infertility, time-limited conception and in assisted reproduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                Mutants comprise at least one electrostatic charge altering mutation in beta hairpin loop, resulting in increased bloactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New mutant cystine knot growth factor proteins comprising one or more mutant subunits, useful for treating or preventing diseases e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the wild type human inhibin B beta subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 298; Page 304; 320pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypothyroidism and thyroid cancer

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factor: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New mutant cystine knot growth factor proteins comprising one or more mutant subunits, useful for treating or preventing diseases e.g. hypothyroidism and thyroid cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 328; Page 305; 320pp; English

Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or prodomain immunogens are useful in monitoring preproinhibin processing in transformant cell culture or in experiments directed an immodulating the climical condt. or reproductive physiology of

Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological matching transforming growth factor facility.
                        Mutant transforming growth factor family proteins or analogues are useful for treatment of ovulatory dysfunction, luteal phase defect, unexplained infertility, time-limited conception and in assisted reproduction.
                                                                                                                                                                                                                                                              This is the wild type human inhibin A beta subunit.

Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bloactivity.
                                                                                                                                                                                                                                                                                                                                                                                   New mutant cystine knot growth factor proteins comprising one or more mutant subunits, useful for treating or preventing diseases e.g.
